Project 4 Group 36

Team Plan

Git repository: https://github.com/dChunGit/EE422C_Project4

David will do methods contained in the Critter class located above the TestCritter class while Faisal will complete the TestCritter class and the remaining methods. We will each do the classes for 2 critters, collaborating on the exact specifications of each class. Both of us will commit frequently to Github, first on separate branches then merging after a review of the code pushed. Faisal will complete the code missing in the Algae class while David will implement the “view” of the world. We will both contribute to the controller class, merging and pushing as code is completed so we do not conflict or double up on code. The most likely split will be 3 commands per person as there are 6 total commands to parse in the controller.

After each merge and after the completion of each stage, both Faisal and David will review the code, bug testing for any errors that appear up to the date of pushing and adding Javadoc comments to the code. When time comes to submit, David will zip all the files up and submit by the deadline.

This document will be updated as specific methods are implemented and milestones passed to keep track of the work each person has done.
